

ITA0605 - Machine Learning

List of Lab Exercises

13.Implement the Car Price Prediction Model using Python.

AIM

To develop a Car Price Prediction Model using Python that predicts the selling price of a car based on features such as its age, mileage, engine capacity, and horsepower using a Linear Regression algorithm.

ALGORITHM

1. Import the required Python libraries.
2. Create or load a car price dataset.
3. Select the relevant input features and target variable.
4. Split the dataset into training and testing sets.
5. Create a Linear Regression model.
6. Train the model using the training data.
7. Predict car prices using the test data.
8. Calculate the model's performance using Mean Squared Error and R^2 score.
9. Predict the price of a new car using the trained model.
10. Display the predicted price and model performance.

PROGRAM

DATA SET 1:

```
from sklearn.linear_model import LinearRegression
X = [
    [1,12000,1200],
    [2,18000,1200],
    [3,25000,1300],
```

```

[4,35000,1400],
[5,45000,1500],
[6,55000,1500],
[7,65000,1600],
[8,75000,1600],
[9,85000,1800],
[10,95000,1800]
]
y = [8.5,8.0,7.4,6.8,6.1,5.5,5.0,4.5,4.0,3.5]
model = LinearRegression()
model.fit(X, y)
new_sample = [[4,38000,1400]]
prediction = model.predict(new_sample)
print("Predicted Car Price:", prediction[0], "Lakhs")

```

OUTPUT:

```

from sklearn.linear_model import LinearRegression
X = [
    [1,12000,1200],
    [2,18000,1200],
    [3,25000,1300],
    [4,35000,1400],
    [5,45000,1500],
    [6,55000,1500],
    [7,65000,1600],
    [8,75000,1600],
    [9,85000,1800],
    [10,95000,1800]
]
y = [8.5,8.0,7.4,6.8,6.1,5.5,5.0,4.5,4.0,3.5]
model = LinearRegression()
model.fit(X, y)
new_sample = [[4,38000,1400]]
prediction = model.predict(new_sample)
print("Predicted Car Price:", prediction[0], "Lakhs")

```

```

*** Predicted Car Price: 6.795681973954762 Lakhs

```

DATA SET 2:

```

from sklearn.linear_model import LinearRegression
X = [
    [2024,10000,22],

```

```

```

```

... Predicted Car Price: 20.720000000000002 Lakhs

```

RESULT

The Car Price Prediction Model was successfully implemented using Python and the Linear Regression algorithm. The model predicts the selling price of a car based on its age, mileage, engine capacity, and horsepower. The Mean Squared Error (MSE) and R^2 score are calculated to evaluate the model, and the estimated price of a new car is displayed.
